

FERFA AWARD WINNING CATTERY FLOOR COMBINES COLOUR WITH CLEANABILITY

► Flowcrete UK has supplied flooring solutions for a new, high-end cattery - a project that won the Highly Commended FeRFA Small Industrial Project 2016/17 award.

The image shows the interior of a large, modern building, likely a cattery. The floor is highly polished and reflective, showing a clear reflection of the ceiling and the structural elements. The ceiling is made of light-colored wooden beams and planks. Several white, square support columns are visible, spaced out along the length of the room. In the background, there is a large glass door or window that looks out onto a green, wooded area. A red text box is overlaid on the right side of the image, containing white text.

► Larton Farm Cattery required a high performance finish that would be durable enough to withstand the site's daily working conditions as well as make sure that the new area would maintain a consistently high standard of hygiene.

Flowcrete UK has supplied industrial flooring solutions for a multifunctional animal care and equestrian facility that wanted to build a new, high-end cattery - a project that won the Highly Commended FeRFA Small Industrial Project 2016/17 award.

Larton Farm Cattery required a high performance finish that would be durable enough to withstand the site's daily working conditions as well as make sure that the new area would maintain a consistently high standard of hygiene. It was also important that the floor's colour and appearance would impress clients when visiting the cattery.

180m² of Flowfresh SL and 210m² of Flowshield FX was installed during a one-week application process. The cream coloured Flowfresh SL coating was applied across the cattery area while Flowshield FX was used to create a stunning black wall way around the room.

Implementing a rigorous and effective cleaning regime

would be critical, especially for contamination prone areas such as underneath the animal cages. The seamless and impervious nature of the chosen flooring solutions was ideal, as any contaminants can be quickly and easily removed from the area. The antibacterial agent Polygiene® is incorporated within every Flowfresh floor, this additive is able to kill up to 99.9% of bacteria, including the Parvovirus and MRSA.

Foot traffic, frequent cleaning and feline habitation would be the main challenges facing the floor. The robust characteristics of Flowcrete's industrial flooring range meant that Larton Farm Cattery's new finish would not deteriorate when faced with the realities of daily use.

Prior to installing the floor, bespoke samples and consultations were provided in order to tailor the project to the client's budget and time frame as well as ensure that the work fitted in with other on-site contractors.
